Test report

AIN28_01

BNetzA-CAB-02/21-01

Product / EUT: RFID reader
Type designation: ARE K1 - RS232
Tested type: ARE K1 - RS232
EUT authorization: ☒ Certification ☐ Declaration of Conformity
☐ Verification
Production level: 03/2016
S/N: 274
Manufacturer: AEG Identifikationssysteme GmbH
Hörvelsinger Weg 47
89081 Ulm / Germany

Test remit: FCC Rules 47 CFR Part 15 – Subpart C – Intentional radiators
in accordance with the procedures given in
§15.207; 15.209

The standards were: ☒ kept*
☐ not kept*

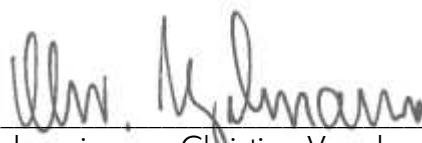

*Remark: ☒ Validation covered by the accredited scope
☐ Validation not covered by the accredited scope
according: _____
☐ Validation of the EMC-requirements partly proceeded

Applicant: AEG Identifikationssysteme GmbH
Hörvelsinger Weg 47

**EUT-
Description:** LF RFID reader with RS-232 I/F.

Voltage supply: 18-30VDC

Fundamental frequency: 125kHz

Frequency list: 7.3728MHz

Temperature range: -20°C to 70°C

Approximate size: LxWxH / cm - 22x12x8

Supplied /
used equipment:

Designation	Type	Manufacturer	S/N
Laptop	Lifebook E8110	Fujitsu Siemens	YK2B046965

Test - / Measurement procedure

Measurements are made with a receiver according CISPR 16 guidelines. A pulse limiter and a 10dB attenuator at the receiver input is used to protect the receiver. The required frequency range is scanned in an automatically operation. When the EUT is arranged the frequency range is monitored. The setup of the equipment and the cables are manipulated within the range to produce the highest emission. Frequency steps of $<0.5 \times$ receiver bandwidth and peak / average detectors are used. If the conducted emission is closer than 20dB to the limits or exceeds, the receiver will retest the emission with quasipeak or average detector. The identified frequency and amplitude of the six highest conducted emissions relative to the limit lines are listed for each current-carrying conductor. If less than six emission frequencies are within the 20dB of the limit, the noise level of the measuring instrument at representative frequencies are reported.

The reported test results are calculated with the following formula:

$$\text{Result (dB}\mu\text{V)} = \text{Reading (dB}\mu\text{V)} + \text{ATF (dB)} + \text{CF (dB)}$$

ATF = Correction factor for the pulse limiter / 10dB attenuator

CF = Correction factor for the cable loss

Test - / Measurement procedure

The test was performed at an antenna to EUT distance of 10m in the frequency range $\leq 30\text{MHz}$ and at 3m distance for frequencies $\geq 30\text{MHz}$. Measurements were made with a CISPR receiver with quasi-peak. The average detector is used in the frequency bands 9-90kHz, 110-490kHz and above 1000MHz. For pulse modulated devices with a pulse repetition frequency of 20Hz or less, peak detector is used (15.35a Note). The frequency, the measured value, antenna information and the limit will be printed out.

The reported test results are calculated with the following formula:

$$\text{Field strength (dB}\mu\text{V/m)} = \text{Reading (dB}\mu\text{V)} + \text{AF (dB/m)} + \text{CF (dB)}$$

AF = Correction factor for the antenna

CF = Correction factor for the cable loss

$$\text{Limit}_{10\text{m}} \text{ (dB}\mu\text{V/m)} = \text{Limit (dB}\mu\text{V/m)} + \text{LCF}_{10\text{m}} \text{ (dB)}$$

Limit_{10m} Limit calculated for 10m test distance

LCF_{10m} = Limit Correction factor for 10m test distance

LCF_{10m} for 30m antenna distance = 20dB

LCF_{10m} for 100m antenna distance = 40dB

LCF_{10m} for 300m antenna distance = 60dB

Test - / Measurement procedure

Position the EUT in front of the measuring antenna. The analyzer is set to peak detector and the trace mode to max. hold. Set the analyzer to the identified fundamental and the sweep is continued until the trace is stabilized. The frequencies of the maximum of the envelope and the outermost points attenuated by 20dB to the maximum are noted.
